

Day 1 summary

The day was started freshly with self introduction of each person and we guys introduced about ourselves and koushik sir started the class in teaching what is skill and what are the different kinds of skills are there. Then he made a conversation like what are all the skills are there in day to day activities. so each one of us told him what are all the skill set are there and he filled board with more than fifty words. The session was more interested with these interactions we made yesterday. Some examples of skill are acting, content writing, singing, vlogging etc.

Then he started the conversation with kinds of skill like straight lined, v shaped line, inverter triangle

In straight lined skill say for an example if a person knows only one skill and he won't know any other skills. Even the person is more experienced in that particular skill it is not efficient if that skill is down in the market there is no value for him.

In the v shaped line if the person is having more than one skill say for an example if a person knows acting, singing and dancing but he doesn't know driving means then it will be a drawback if he is in the emergency situation.

The last concept is inverter triangle. In this type if one person knows every skill only a little bit but he is not strong enough. Even in this condition the person can be able to manage the things very well.

Conclusion:

In the above said kinds of skill, what I learned was like a person should know every skill even he is not strong in it also can handle the things wisely.

Farmer story (problem solving)

Then koushik sir gave us the interesting problem to solve. In that there is a river where one boat is there and in one side of the river there is a fox, ricebag, farmer and hen are there. These four should cross the river with the help of that boat. But there is a constraint is having like only two should cross the river at a time and after crossing the river one should get down and the other should go along with the boat to take one more with them so that the four of these can cross the river.

The following are the constraints to follow

Hen and ricebag cannot be together

Fox and hen cannot be together

We guys were made a discussion on that to solve this problem and we came up with the solution where first the farmer takes the hen and crossed the river and leave it there. And he came along with the boat and took the fox and crossed the river and he again take the hen because the constraint (hen and fox cannot be together) is followed. then he leave the hen and taken the ricebag and crossed the river. so finally he went and taken the hen back and crossed the river.

Conclusion:

The conclusion of this story is that we need to think logically with the given constraint.

We need to think in what are all the ways we need to solve the problem .

Then koushik sir explained how important is the problem solving skills we need .Then he told to solve puzzles whatever it may be solving gaming puzzles which increases our thinking capacity.Due to these practices we will become more efficient in solving the problems so that we can handle the problems very easily.

EXTREME OWNERSHIP:

Then he told to read a book named" EXTREME OWNERSHIP" and he specifies that we guys need to submit it in a summary format about the book at the end of the internship .

He also taught us how important the reading skill is so that we can able to focus on one thing and also it helps us to gain knowledge.

Afternoon session:

Abraham sir made a Q and A session about what koushik sir taught us in the morning.In this session each person told about their skills and he told everyone to list down their top most five skill stack from the given "common skill list".we guys wrote and rated each skill like from five star to one star.

The session was energetic with these interested topics.

Then finally he told about the internship like how it will be and how it will be works and what are the process are there and all.
